Commuter couples and careers
Moving together for him and apart for her

Marta Murray-Close

University of Massachusetts Amherst

Minnesota Population Center
February 8, 2016
Marriage: A universal institution that involves a man and a woman living together, engaging in sexual activity, and cooperating economically (George Murdock, 1949)
The co-location problem

Best job for wife

Best job for husband

Okay job for both
The two-body problem

- Only
  - Best job for wife

- Only
  - Best job for husband

- Okay job for both
Co-residential couples prioritize men’s employment

- Men’s human capital predicts migration more strongly than women’s (Compton and Pollak, 2007; McKinnish, 2008)
- Family migration harms women’s employment and earnings (Smits, 1999; McKinnish, 2008; Cooke et al., 2009)
Why do couples prioritize men’s employment?

- **Human capital** (Sandell, 1977; Mincer, 1978; Guler et al., 2012)
- **Gender-role attitudes** (Bielby and Bielby, 1992; Jürges, 2006; Cooke, 2008)
Living apart may level the playing field

- “Commuter couples” express egalitarian commitments (Gross, 1980; Gerstel and Gross, 1982; van der Klis and Mulder, 2008; van der Klis and Karsten, 2009)

- But don’t know if
  - Qualitative findings are representative
  - Commuter couples are more egalitarian than others

- To test competing models, need representative data with
  - Noncohabiting and cohabiting couples
  - Information about both spouses
Question: Does specialized human capital increase the probability of marital noncohabitation more for women than for men?

Method: Use data from the ACS to construct a sample of previously noncohabiting couples.

Answer: Yes.
Hard to find data on commuter couples

- Need large dataset
- Need information about living arrangements
- Need information about both partners
Previous work on commuter couples

“Living Apart, Advancing Together: Commuter Couples and the Tenure-Track Gender Gap in the US Economics Job Market”

- **Question**: Do the cause and consequences of commuting differ by gender?
- **Data**: Longitudinal survey of new entrants to US junior PhD job market in economics
- **Method**: Regressions controlling for academic background, partner education, and family circumstances
- **Results**: Commuting predicts tenure-track employment more strongly for women
- **Results**: PhDs with egalitarian gender-role attitudes are more likely to commute
Help from the American Community Survey?

Can identify people who are

1. Married
2. In a household without their spouse

- Pro: Captures all noncohabitors in the cross section
- Con: Know nothing about absent spouse
Help from the American Community Survey?

Can identify couples who are

1. Married
2. Living in the same household
3. Lived in different locations one year ago
4. Were married one year ago

- **Pro**: Have matched information about spouses
- **Con**: Captures only noncohabitators who reunite
- **Con**: Underrepresents long-term noncohabitators
Data

Integrated Public Use Microdata Series (IPUMS)
   ↦ American Community Survey (ACS)
      ↦ 2008-10 three-year sample

Baseline sample includes people
   ▶ Age 25 to 59
   ▶ Employed in last five years
   ▶ Last worked in civilian occupation
   ▶ Lived in US last year
What qualifies as living in different locations?

*Notes: Table shows two most common occupations for men and women with each level of education.*
Baseline model + occupational controls

\[
\log \left( \frac{P(E = 1)}{P(E = 0)} \right) = \beta_0 + E_d h \beta_1 + E_d w \beta_2 + X_c \beta_3 + Occ_h \beta_4 + Occ_w \beta_5
\]

*Occ_h* and *Occ_w* contain

- Measure of occupational location constraints
- Average wage in occupation
Measuring occupational location constraints

- Migration rate (McKinnish, 2008).
- Geographic clustering (Benson, 2015).
- Urban concentration (Compton and Pollak, 2007).
- Proportion not in birth state.
Measuring occupational location constraints

Largest occupations with very high proportion (between 0.49 and 0.72) of workers not in birth state:

- postsecondary teachers
- computer scientists, systems analysts, and web developers
- managers in marketing, advertising, and public relations
- lawyers, judges, magistrates, and other judicial workers
- software developers
- physicians and surgeons
- management analysts
- computer and information systems managers
- clergy
- editors, news analysts, reporters, and correspondents
- electrical and electronics engineers
- engineers, not elsewhere classified
- artists and related workers
- actors, producers, and directors
- writers and authors

Conclusions

- Used ACS data to construct sample of previously noncohabiting husbands and wives who reunited in last year
- Consistent with previous research, men’s human capital predicts migration
- In contrast, women’s human capital predicts noncohabitation
Have we seen this before?

- Professional commitments carry a personal cost for women
- Commuter partnerships are like women keeping their names at marriage (Goldin and Shim, 2004)
- We need better data on multi-household families
- Commuter marriage challenges traditional definitions
Thank you!
